ADR-002: Require \textttworld.png in Experiment Exports

Status

Approved

Context

Visualizing world maps requires rendering 2D elevation, biome, and river layers.

Decision

Require the simulation to save and export \textttworld.png directly into the ZIP archive. We will not run serverless Python instances to re-render the world on the fly.

Consequences

Minimizes backend cold starts, simplifies upload validation, and guarantees instant image load times on client devices.
